

Pressure sensors are widely used in Air Conditioning, Refrigeration and Heat Pump system. Using a 5V excitation input these sensors provide a 0.5-3.5 V or 0.5-4.5 V ratiometric signal output proportional to the pressure of the medium. This device requires no end user amplification. Pressure sensors permit to control and guarantee the system working under safe and stability condition.

- Note:**
- 1) Signal span: $VFS=FS$ (Full Scale) = $VA(pr) - VA0$
 - 2) Accuracy measured within the temperature ranges shown in Table 1:
Included Nonlinearity (L) and pressure hysteresis. The Nonlinearity is the deviation of the real sensor characteristic $VA = f(p)$ from the ideal straight line. It can be approximated by a polynomial of second order, with the maximum at $px = pr / 2$.
The equation to calculate the nonlinearity is: $L = (VA(px) - VA0) / (VA(pr) - VA0) - px / pr$
 - 3) Response Time: delay between a pressure change (10 to 90% pr) and the corresponding signal output change (10 to 90% FS)
 - 4) Insulation Resistance measured with rated voltage: 500 VDC
